CaminoTrack

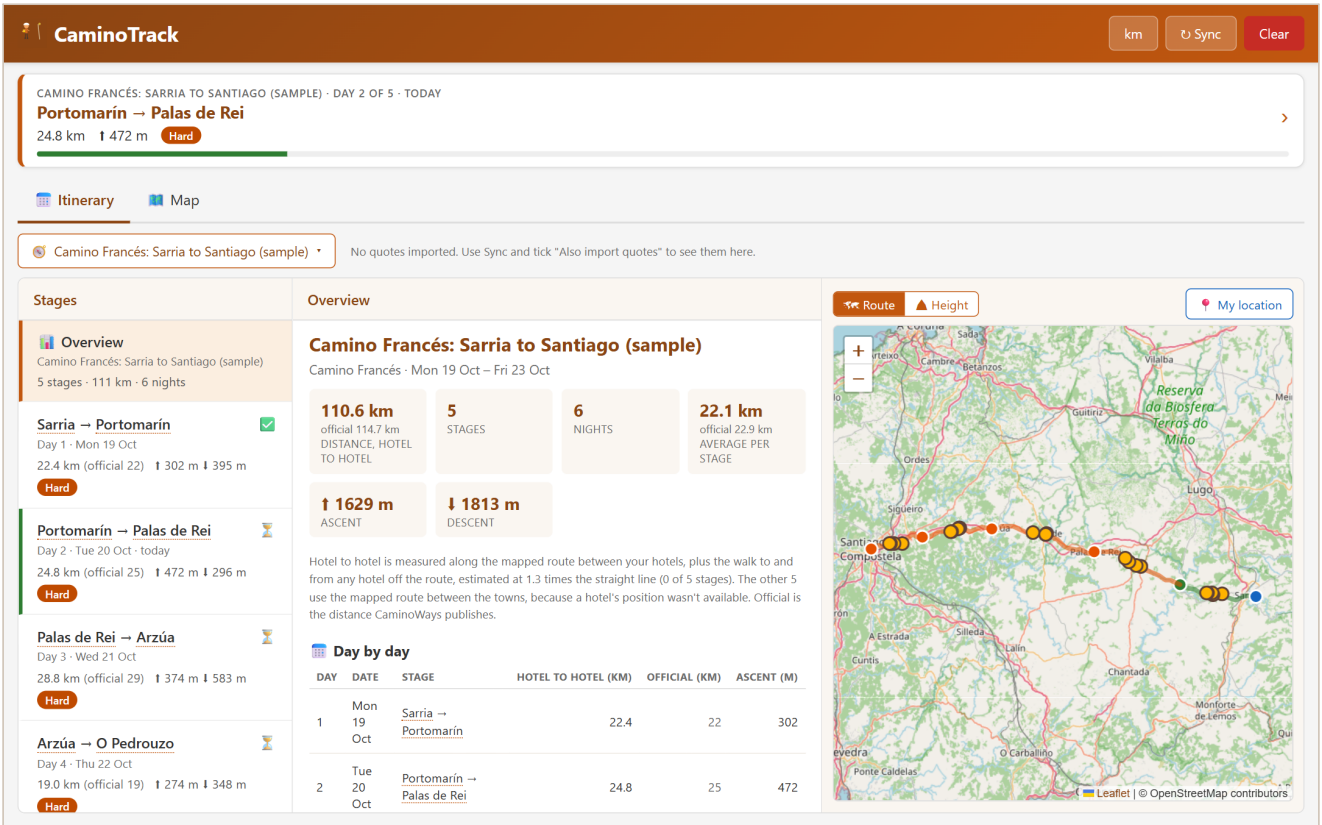

Your CaminoWays booking, turned into a day-by-day walking companion for phone, iPad and desktop.

CaminoTrack takes a walker's CaminoWays booking and shows each walking day the way a walker needs it: how far it really is from hotel to hotel, how much climbing there is, which villages are passed, where the food and water stops are, and where the long stretches with nothing are. On the trail it shows a live map, tells the walker how far they have come and how far is left, and keeps working with no signal.

Everything CaminoWays already knows about the booking is one tap away in the **CaminoWays tab**, on every stage:

The CaminoWays tab: your booking, one tap away

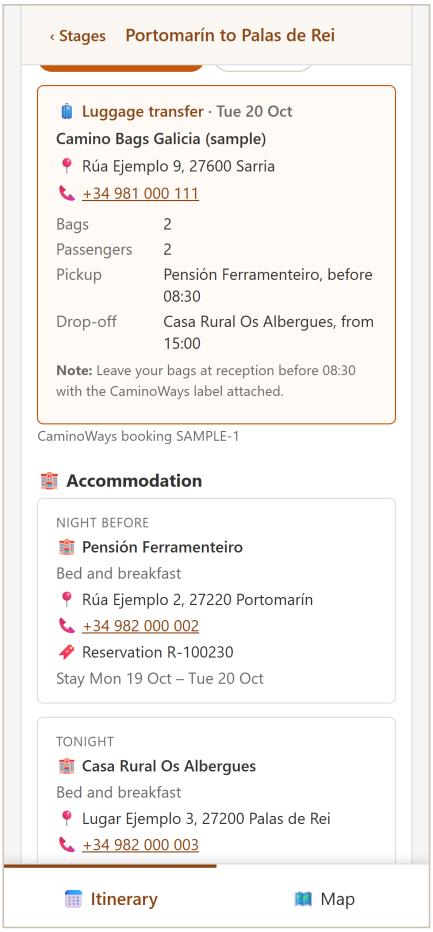

- **Check on services easily:** tap Luggage transfer, People transfer or Dinner to see the provider, address, phone number, number of bags, pick-up and drop-off, and the notes CaminoWays gave.
- **Find your hotel's phone number** for the night before and tonight, with its address, board basis, reservation number and a link to the map. One tap calls it.
- **See the luggage transfer details** for the day, and open them straight from the Tonight card on the day's main page.

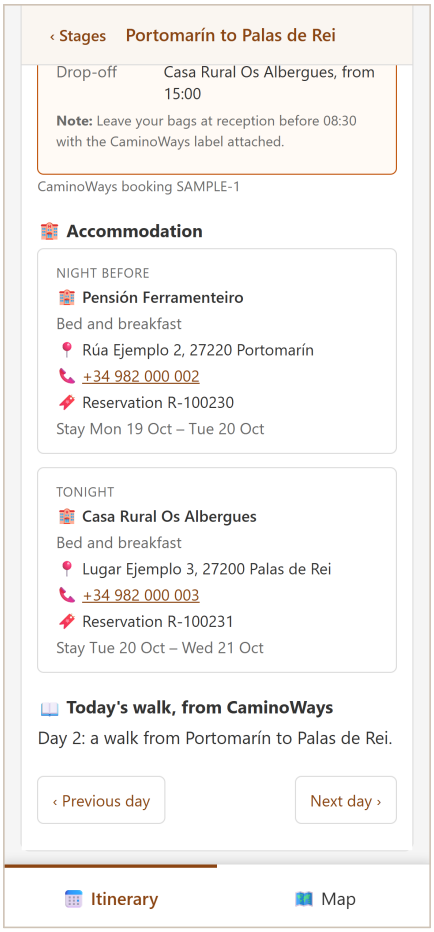

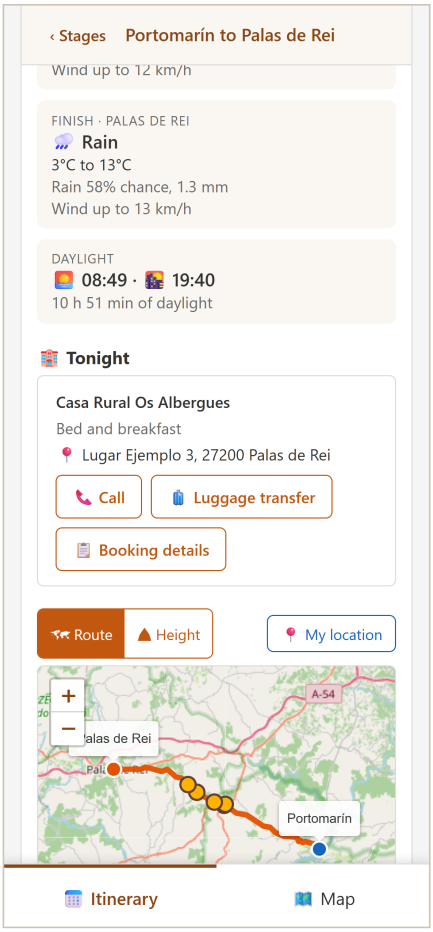

Desktop: the Today strip, the trip's stages, the trip overview and the route map.

The CaminoWays tab, on the phone

Each stage has two views: **General** (the route, the day and the weather) and **CaminoWays** (the booking). The phone screens below show the booking for day 2, from Portomarín to Palas de Rei.

Services at a glance. *The service level, the nights and what is included. Tap Luggage transfer to open its details: provider, phone, bags, pick-up and drop-off, and notes.*

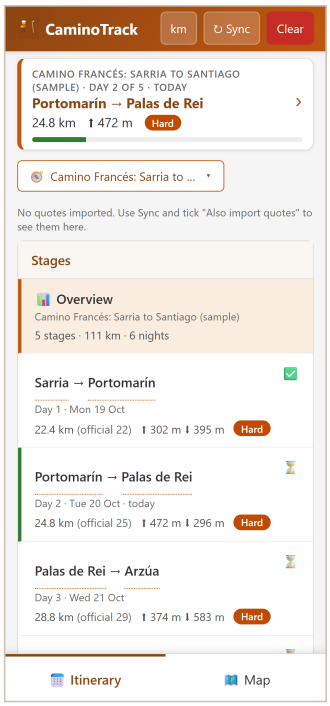

Hotel details. *The night before and tonight, each with address, board, reservation number and a phone number that calls with one tap.*

Tonight card. *On the day's main page: Call the hotel, open the Luggage transfer, or go to the booking details (and Navigate, where the hotel's position is known).*

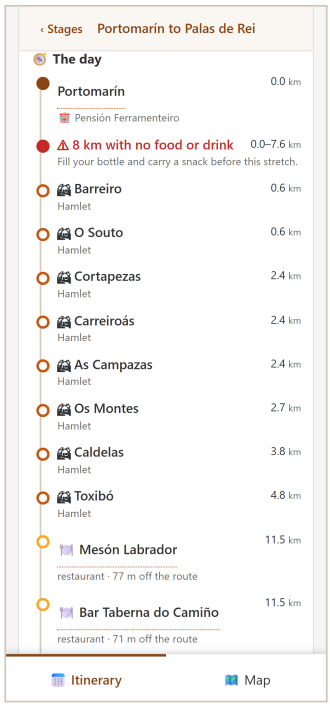

Sample data: the hotels, phone numbers and the transfer company in these screens are invented for illustration.

On the phone: the day and the trail

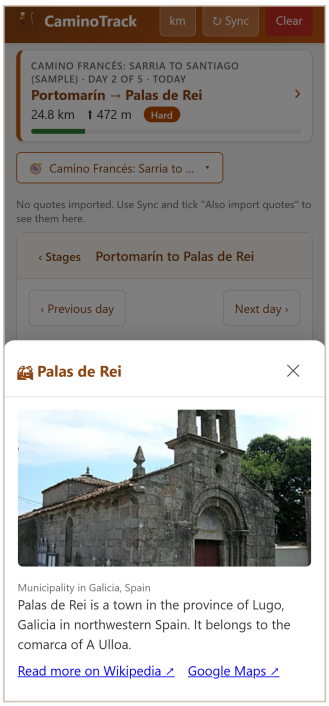

Most walkers will use CaminoTrack on a phone, so that is the primary design. The app can be added to the home screen and opens like any other app, with no app-store download.

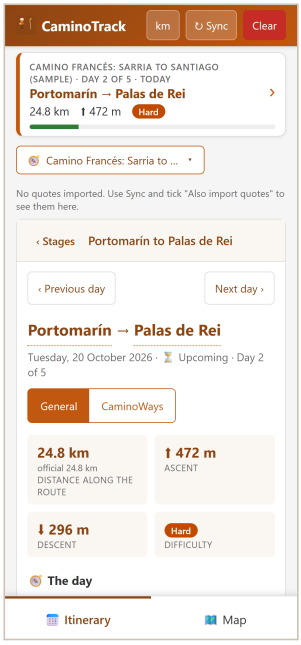

Today at a glance. *The strip at the top always shows where the walker is in the trip and opens today's stage.*

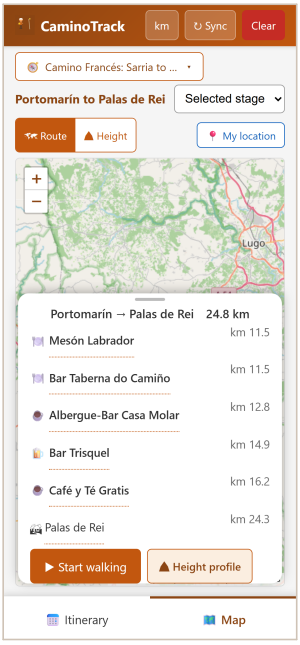

The day as a timeline. *Villages, places to eat and the longest stretch without food, with the distance to each.*

Tap a town *for a short description, a photo and nearby sights, in English, from Wikipedia.*

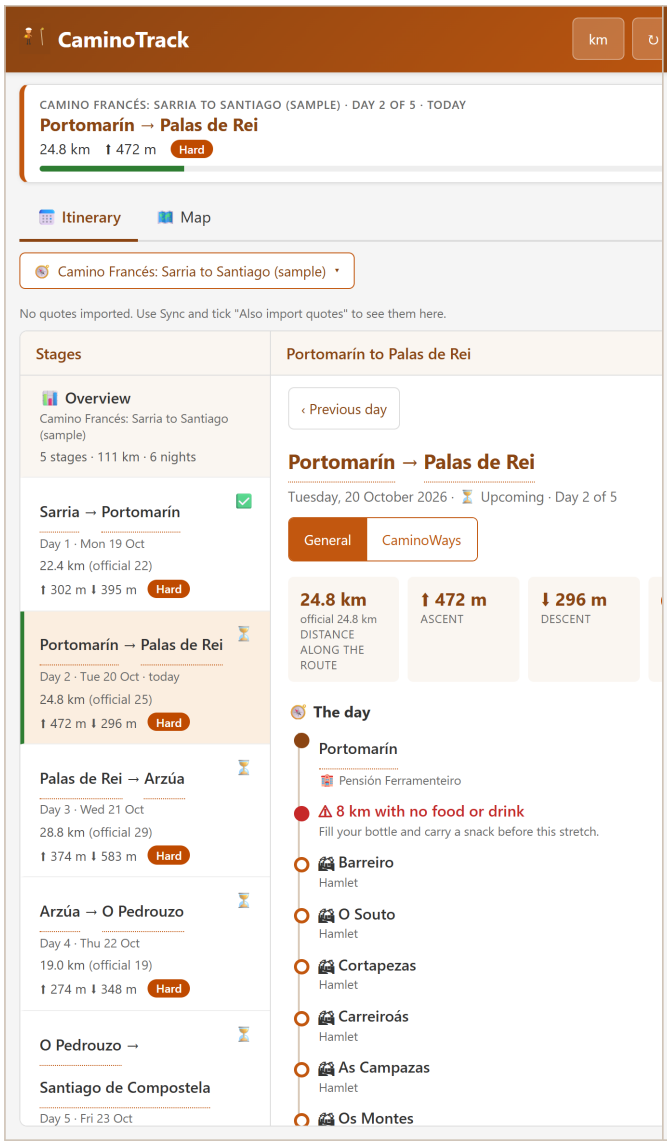

Stage summary. *Hotel-to-hotel distance, ascent, descent and a difficulty rating, with General and CaminoWays views and previous and next day buttons.*

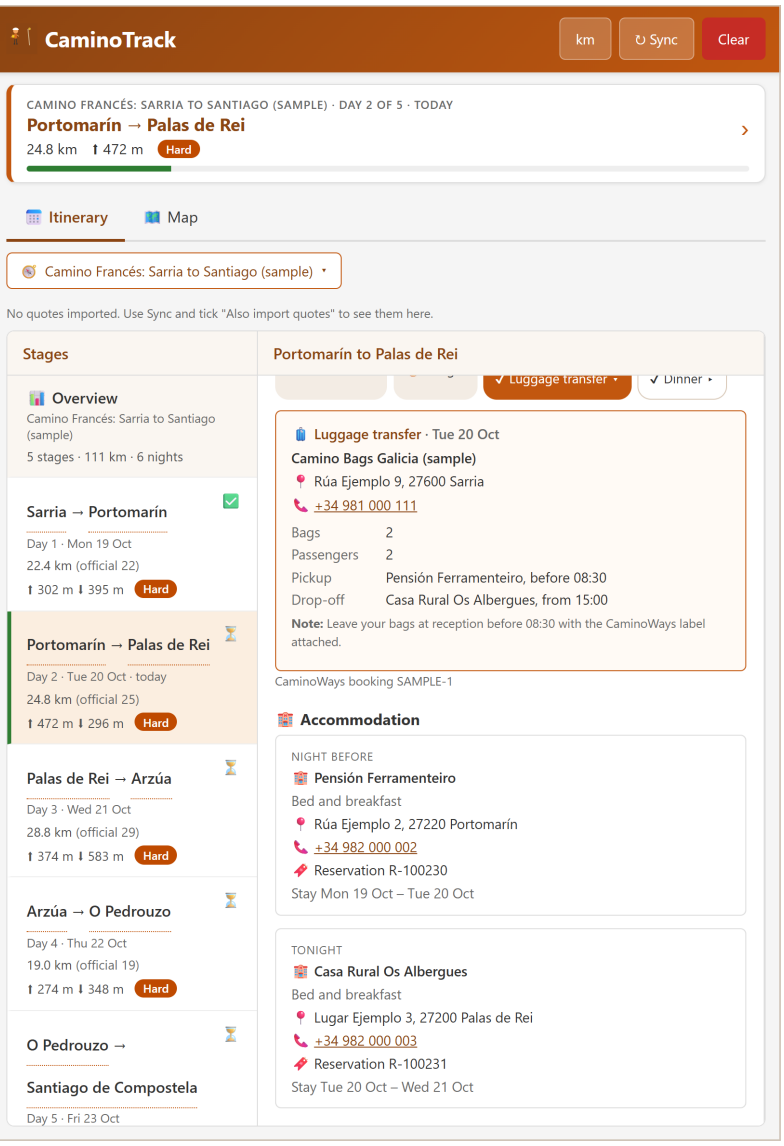

Walking mode. *On the Map tab, pull up the panel at the bottom of the map (swipe it up or tap its handle) and scroll to the bottom of the panel, where the* ***Start walking*** *button is. The map then follows the walker.*

On the iPad

On a tablet the stage list and the day's detail sit side by side, so the walker can flip between days quickly when planning the evening before. The CaminoWays tab opens next to the same list of stages.

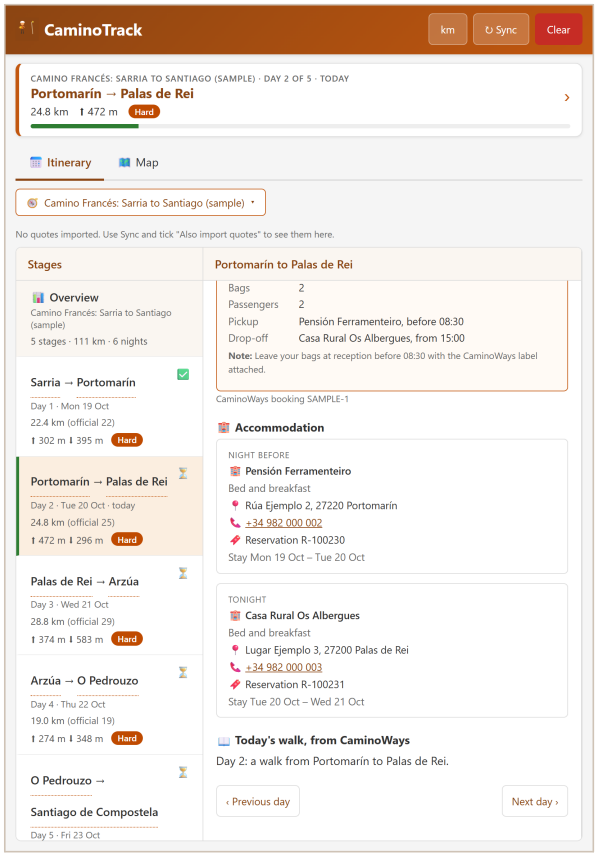

The General view: the day's figures and its timeline, with the stage list beside it.

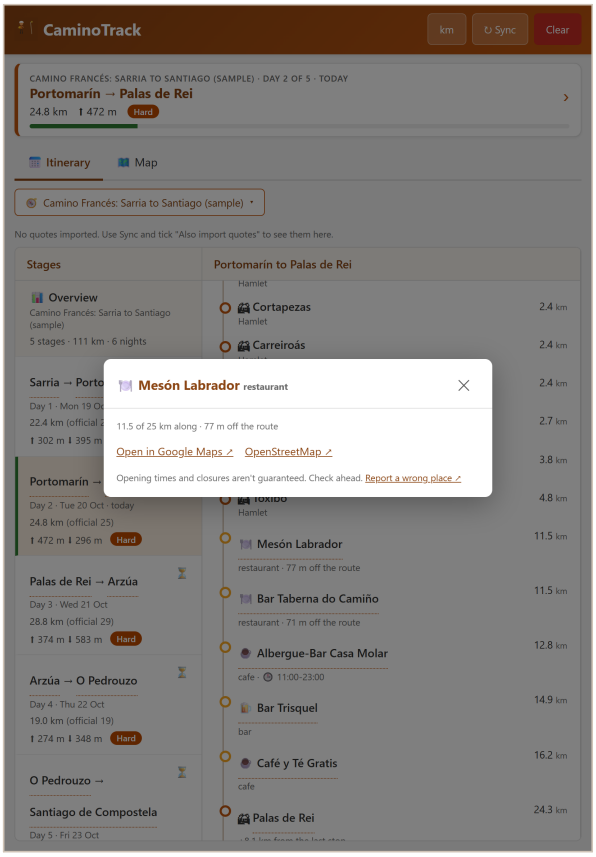

The CaminoWays view: the booking, with the luggage transfer opened.

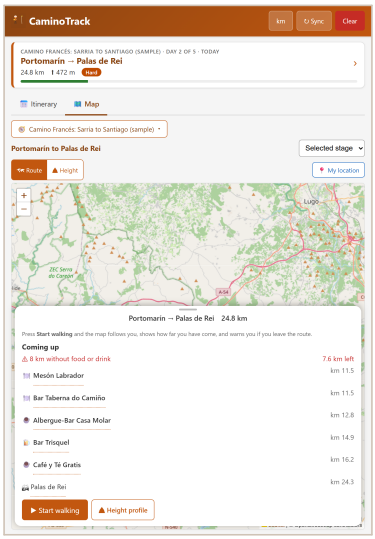

On the iPad: hotels, places to eat and walking mode

Hotel details for the night before and tonight, each with a phone number that calls with one tap.

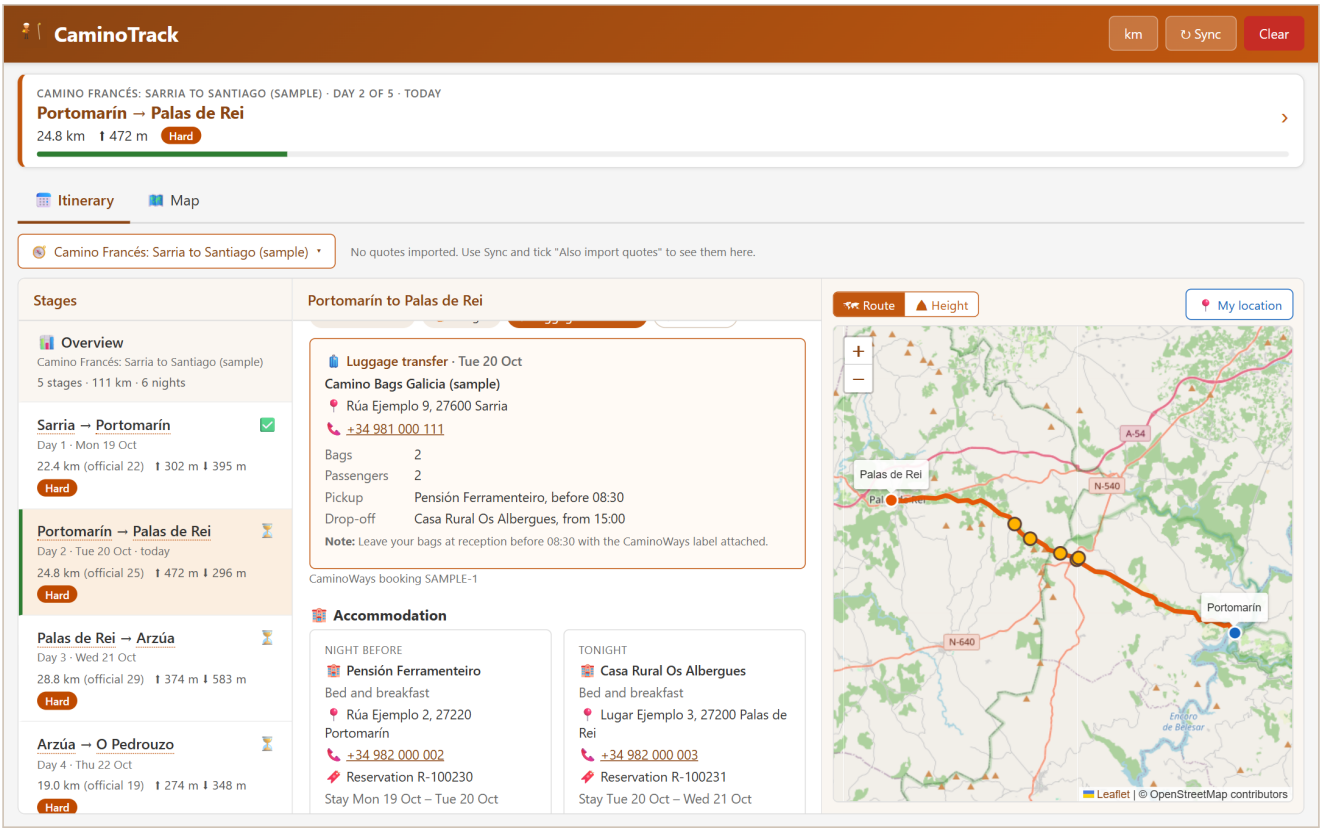

Tapping a place to eat shows how far along the stage it is, how far off the route, and links to maps.

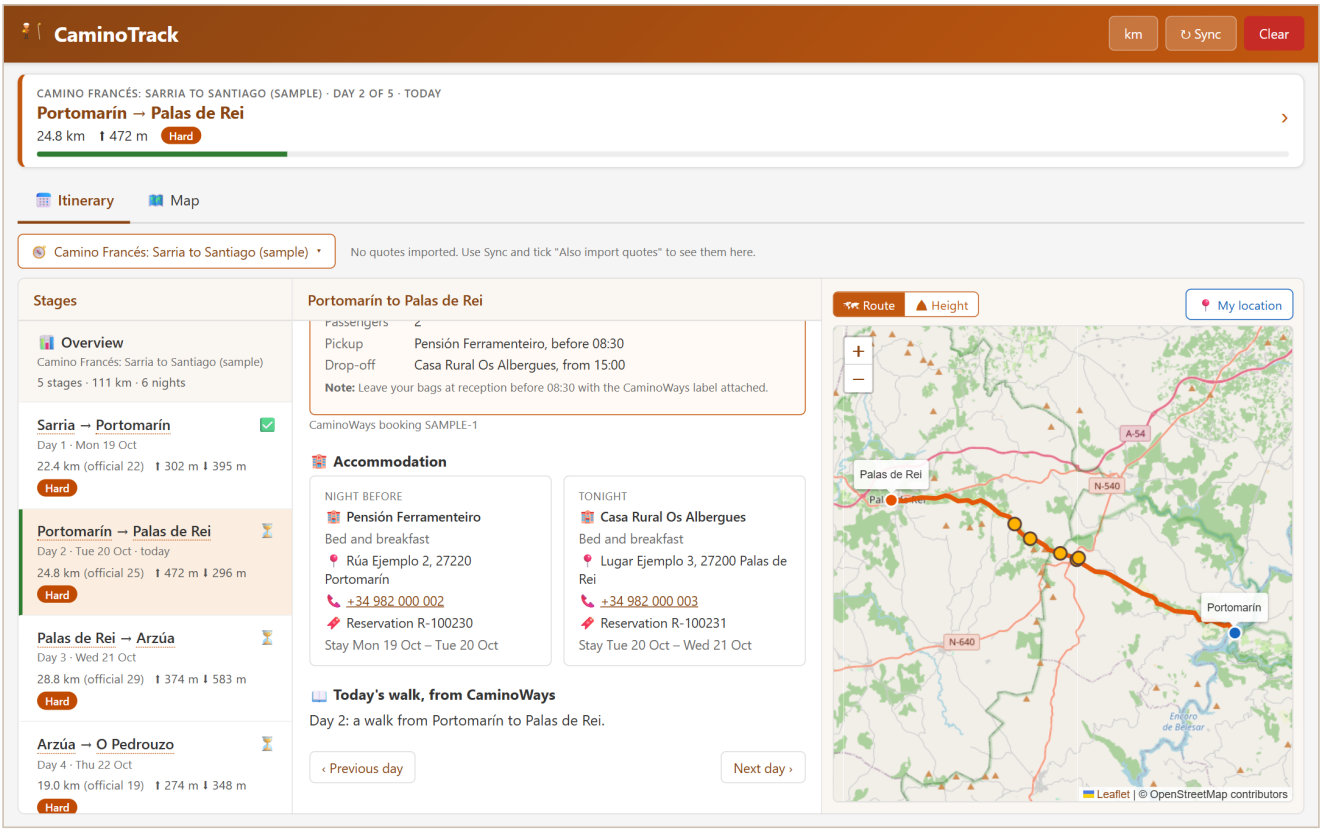

*Walking mode: open the panel at the bottom of the map and press **Start walking**.*

On the desktop

On a wide screen everything is visible at once: the stages, the detail for the selected day and the map. This suits planning, and checking a whole trip before departure.

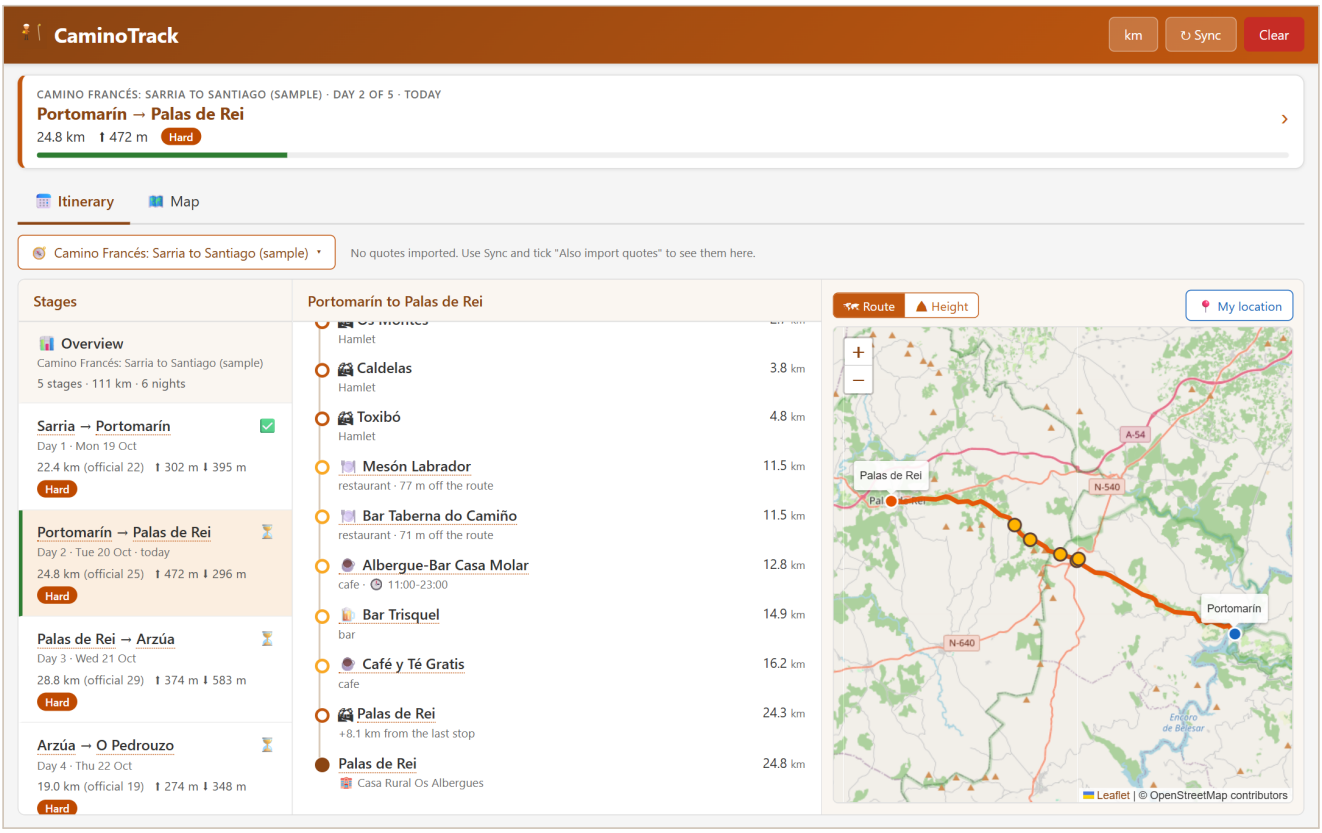

The CaminoWays tab on a wide screen: service level, what is included, and the luggage transfer opened, with the route map beside it.

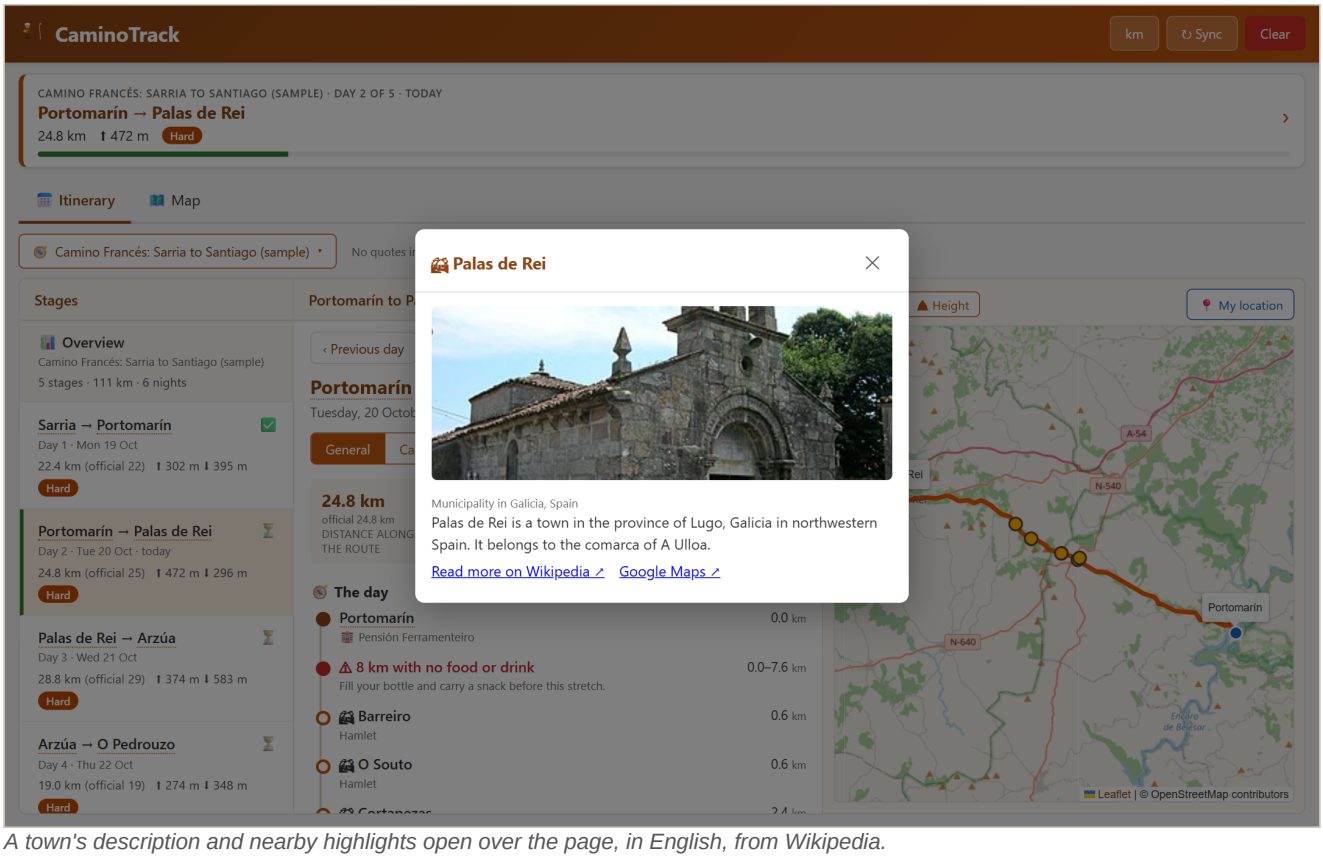

Hotel details further down the same tab: phone number, address, board and reservation number.

On the desktop: the day and its towns

The day's timeline with the route map beside it.

A town's description and nearby highlights open over the page, in English, from Wikipedia.

What the app does

The CaminoWays tab

- **Your booking.** The service level, the number of nights, the booking or quote reference, and the day's description from CaminoWays.
- **What is included, as tappable chips.** Luggage transfer, People transfer and Dinner each open their own details.
- **Luggage transfer details.** The provider, address and phone number (tap to call), the number of bags and passengers, pick-up and drop-off, and any notes CaminoWays gave. People transfers and dinners show the same kind of detail.
- **Hotel details for the night before and tonight.** Name, address, phone number (tap to call), board basis, reservation number, stay dates and a link to the hotel on the map.
- **The Tonight card** on the day's main page brings the useful parts forward: Call the hotel, open the Luggage transfer, open the booking details, and Navigate to the hotel where its position is known.
- **Only what is needed.** Passenger names and email addresses are deliberately left out; the app keeps only what a walker needs to use the service.

Your itinerary, with the real figures

- **Sync** reads the walker's own CaminoWays bookings and turns each trip into one stage per walking day, with dates, hotels and the CaminoWays distances.
- **Hotel-to-hotel distance** is measured along the mapped route between the two hotels, plus the walk to and from any hotel off the route. The published CaminoWays distance is shown beside it.
- **Ascent, descent and difficulty** for each day, from open elevation data. Difficulty compares the day with every stretch of the same length on that route, and with the rest of the trip.
- **Trip overview** with total distance, climb, nights and a day-by-day table; a drop-down switches between trips.

Along the way

- **Villages and towns passed**, in walking order with the distance to each.
- **Places to eat and drink** from OpenStreetMap, with opening hours where known, and a clear warning when there is a long stretch with no food or water.
- **Town descriptions and nearby sights** in English, from Wikipedia. Only places that have an English article are tappable, so the app never opens an empty page.

On the trail

- **Walking mode.** Open the panel at the bottom of the Map tab and press Start walking. The map follows the walker, shows distance done and left, the next village, and warns if they leave the route. The screen stays on while following.
- **Works offline.** A stage's town descriptions can be saved before leaving a hotel with wifi, and the app keeps working with no signal.
- **km or miles** at the touch of a button, and a Today strip that opens the current day.

Privacy and cost

- Nothing is stored on a server. The CaminoWays login is used for the one sync request and is never stored or logged. The stages are kept in the walker's own browser.
- Route data comes from public sources: OpenStreetMap, open elevation data and Wikipedia. There is no account to create and nothing to install.

Coverage and how it is built

Routes built so far

- **Camino Francés**, Saint-Jean-Pied-de-Port to Santiago, with 533 villages and hamlets on the route.
- **Via Francigena in Tuscany**, Lucca to Siena, with 72 villages and hamlets on the route.
- Town descriptions, in English, are stored for the 116 of those 605 places that have an English Wikipedia article. A trip on a route that has not been built is still shown from the CaminoWays data, without route figures.

How it is built

- A small Python (FastAPI) web service with a plain JavaScript front end and a Leaflet map. It runs on Google Cloud Run and scales to zero when idle.
- It can run on any host that runs a web service.

Possible next steps

- **An iPhone and Android app.** Turn CaminoTrack into a native app for both phone platforms, so it can be installed from the App Store and Google Play. Today it runs in the browser and can be added to the home screen.
- More routes, built the same way as the two above.
- Google ratings and reviews on places to eat. This is an optional feature that needs a Google key.

Screenshots in this document use a sample five-day trip, Sarria to Santiago, created for illustration. The hotels, phone numbers and transfer company shown in the CaminoWays tab are invented. They do not show a real booking. Distances, climbs and places are calculated by the app from the mapped route.
